

OBJECTIVES

- Automate library operations: A library management system streamlines manual procedures by automating activities including book procurement, cataloguing, circulation, and inventory control.
- Boost productivity and accuracy: By automating operations, lowering errors and inconsistencies, and allowing librarians to complete jobs more rapidly, a library management system aids in boosting productivity and accuracy.
- Improved user experience thanks to an intuitive interface that makes it simple for users to find and borrow books, renew them online, and retrieve their borrowing records.
- Increased accessibility: Using a computer or mobile device, users can browse the library catalogue and conduct book searches at anytime, anywhere.
- Streamline administrative duties: A library management system reduces the workload for librarians by streamlining administration operations including report preparation, fine management, and user management.
- Provide useful information: A library management system offers useful statistics and insights, such book circulation, user demographics, and inventory levels, that can assist librarians in improving services and making well-informed decisions.

A library management system's overall goal is to enhance library operations and services by giving users and librarians access to a dependable and effective tool that streamlines procedures and automates jobs.
